EP 0 579 496 A1

The present invention relates to novel 4-aminoquinazoline derivatives. More particularly, this invention relates to:

(i) 4-aminoquinazoline derivatives of the following formula:

15 wherein all of the symbols have the same meanings as described hereinafter, and the pharmaceutically acceptable acid addition salts thereof, the pharmaceutically acceptable salts thereof, and the hydrates thereof, which have inhibitory activity on cyclic guanosine 3',5'-monophosphate phosphodiesterase, or additionally on thromboxane A<sub>2</sub> synthetase,

(ii) processes for the preparation thereof,

20 (iii) inhibitors of cyclic guanosine 3',5'-monophosphate phosphodiesterase, or additionally of thromboxane A<sub>2</sub> synthetase containing them, and

(iv) methods of prophylactic and curative treatment of mammals, including humans, by administering an effective amount of the compounds of the formula (I), the pharmaceutically acceptable acid addition salts thereof, the pharmaceutically acceptable salts thereof, and the hydrates thereof, to the patient to be treated.

25 Cyclic guanosine 3',5'-monophosphate (abbreviated as cGMP hereafter) was found in urine in rats by D. F. Ashman in 1963. Till now, it has been known that cGMP is distributed broadly in tissues of any animals including human beings. cGMP is biosynthesized from guanosine triphosphate (GTP) by the action of guanylate cyclase.

30 cGMP has been experimentally confirmed to have various physiological activities. For example, cGMP induces the relaxation of heart muscle and of smooth muscle. Further, it is related to the formation of neuronal synapses, and it acts as a trigger of cell proliferation and it induces the proliferation of lymphocyte.

cGMP is metabolized to physiologically inactive 5'-GMP by the action of cGMP phosphodiesterase (abbreviated as cGMP-PDE hereafter).

35 Accordingly, the inhibition of the action of cGMP-PDE is considered to be useful for the prevention and/or treatment of diseases induced by enhancement of the metabolism of cGMP, such as hypertension, heart failure, myocardial infarction, angina, atherosclerosis, cardiac edema, pulmonary hypertension, renal insufficiency, nephrotic edema, hepatic edema, asthma, bronchitis, dementia, immunodeficiency.

40 On the other hand, thromboxane A<sub>2</sub> (abbreviated as TXA<sub>2</sub> hereafter) was found as a constituent of the arachidonate cascade, in platelets by M. Hamberg in 1975. TXA<sub>2</sub> is biosynthesized from arachidonic acid released from cell membrane via prostaglandin G<sub>2</sub> and prostaglandin H<sub>2</sub>, and rapidly metabolized to inactive thromboxane B<sub>2</sub>. TXA<sub>2</sub> is known to induce platelet aggregation and to contract smooth muscle, particularly blood vessel muscle and bronchial muscle. TXA<sub>2</sub> synthetase was isolated and purified from microsome in platelets.

45 Accordingly, the inhibition of TXA<sub>2</sub> synthetase decreases the biosynthesis of TXA<sub>2</sub>, and is useful for the prevention and/or treatment of inflammation, hypertension, thrombosis, arteriosclerosis, cerebral apoplexy, asthma, myocardial infarction, cardiostenosis, cerebral infarction, etc.

It is considered that almost any disease occurs by the complex interaction of plural mechanisms. Accordingly, the inhibition of any one of the plural mechanism is not adequate to treat a disease. A medicament inhibiting as many mechanisms as possible, which induce the disease, is considered to be effective and ideal.

50 Especially, it is very useful for the prevention and/or treatment of diseases induced by platelet aggregation, e.g. angina pectoris, heart failure, pulmonary hypertension and various kinds of renal diseases to have inhibitory active on both cGMP PDE and TXA<sub>2</sub> synthetase.

## 55 Related Arts

Up to now, some compounds have been known as cGMP-PDE inhibitors, for example,

## Zaprinast

(A)

## AR-L 57

(B)

## MY-5445

(C)

Many compounds derived from the above lead compounds have been proposed and many patent applications relating to those have been filed. For example, as derivatives of Zaprinast, compounds wherein the 1H-1,2,3-triazole skeleton is replaced by various other hetero cycles (see USP-5047404), those wherein the triazole is replaced by a benzene ring (see EP-371731), and those wherein the triazole is eliminated, i.e. those having only the pyrimidine skeleton (see EP-395328), have been proposed. The above mentioned compounds always contain an oxo group at the 4th position of the pyrimidine skeleton. The compounds having an amino group at the said position are described in USP-4060615. The specification discloses 4-amino-6,7-dimethoxy-2-piperazinyquinazoline derivatives of the following formula:

(D)

wherein  $R^d$  is amino or hydrazino,  
 $R^{1d}$  is C3-8 cycloalkyl, C3-8 methylcycloalkyl or C4-8 cycloalkenyl,  
 and their acid addition salts.

Furthermore, some  $TXA_2$  synthetase inhibitors have been known, for example,

OKY-046

(E)

ONO-1581

(F)

Many derivatives containing an imidazole or pyridine ring as the basic skeleton have been proposed. However, there appears to be no  $TXA_2$  synthetase inhibitor having both the said ring and quinazoline ring.

On the other hand, many compounds having a quinazoline ring as the skeleton, which are not known to have inhibitory activity on cGMP-PDE and/or on  $TXA_2$  synthetase, have been proposed.

For example, as to 4-aminoquinazoline derivatives having cyclic groups at the 2nd position thereof and as N-substituent,

Especially, it is very useful for the prevention and/or treatment of heart failure, angina pectoris, pulmonary hypertension, various kinds of renal diseases, hyoiuresis induced by heart failure.

The inhibitory effect on cGMP-PDE and TXA<sub>2</sub> synthetase, of the compounds of the present invention were confirmed by screening tests as described below.

#### Method

PDE IC was isolated from human platelets according to standard methods previously described in Lugnier, C. et al., *Biochem. Pharmacol.* 35: 1743, 1986 (incorporated in its entirety by reference). Typically, connective tissue and adventitia were removed and 1-2 units of platelets were suspended in 10 volumes of buffer A (20 mM Tris-HCl, pH 7.5, containing 2 mM magnesium acetate, 1 mM dithiothreitol, and 5 mM Na<sub>2</sub>EDTA) using a Brinkman polytron. The proteinase inhibitors leupeptin, pepstatin A, and phenylmethyl-sulfonyl fluoride (PMSF) were also included in this buffer (final concentration of 100 nM each). The homogenate was centrifuged at 100,000g for 60 minutes. The supernatant was then removed and filtered through four layers of cheesecloth. The supernatant was applied to a DWAE-Trisacryl M column. The column was washed with several bed volumes of buffer B (20 mM Tris-HCl, pH 7.5, containing 2 mM magnesium acetate, 1 mM dithiothreitol, and proteinase inhibitors) and eluted by two successive linear NaCl gradients (0.05-0.15 M, 300 ml total; 0.15-0.40 M, 200 ml total). Five milliliter fractions were collected and assayed for cyclic GMP PDE activity.

Phosphodiesterase activity was measured, as described by Thompson, et al., *Adv. Cyclic Nucleotide Res.* 10: 69, 1979 (incorporated in its entirety by reference), in a reaction medium containing 40 mM Tris-HCl (pH 8.0), 5 mM MgCl<sub>2</sub>, and 1 mM dithiothreitol. The concentration of substrate (<sup>3</sup>H-cGMP) was 0.2mM. Compounds of the present invention were dissolved in dimethyl sulfoxide (DMSO) at a final concentration of 2.5%. This concentration of DMSO inhibited enzyme activity by approximately 10%. The IC<sub>50</sub> values (concentration that produced 50% inhibition of substrate hydrolysis) for the compounds examined were determined from concentration-response curves in which concentrations typically ranged from 10<sup>-8</sup> to 10<sup>-3</sup> M for the less potent inhibitors (half-log increments).

## 45 Method

Male Wistar rats were starved overnight. Five hundreds microliter of heparinized (10U/mL) whole blood was collected from abdominal aorta using polyethylene syringe (needle: 22 or 26G). The blood freshly drawn from animal was preincubated with 5  $\mu$ L of test compound at 37 °C. Five minutes later, 2.5  $\mu$ L of 6 mM of Ca ionophore A23187 (final concentration of 30  $\mu$ M) was added into tube, and incubation mixture was further incubated for 15 min. The reaction was terminated by centrifugation of tubes at 12,000 rpm for 2 min. TXB<sub>2</sub> content in the supernatant was determined by EIA as follows.

One milliliter of 0.5 M glycine-HCl buffer (pH 3.2) was added to 100  $\mu$ L of sample. The samples were mixed well and centrifuged at 1,700 G for 10 min at 4 °C. The extracted supernatant was applied to a SEP-PAK (registered Trade Mark) C<sub>18</sub> cartridge (Waters Assoc.). After washing with 10 mL of distilled water followed by 10 mL each of 15% ethanol and petroleum ether, the sample was eluted with 3 mL of ethyl acetate. The ethyl acetate fraction was evaporated to dryness under gentle N<sub>2</sub> stream and the residue was dissolved in EIA buffer

(final volume of 1 mL) following the addition of 300  $\mu$ L of 0.01 M  $\text{NaHCO}_3$ -NaOH buffer (pH 10.0). EIA for  $\text{TXB}_2$  was carried out according to a legend attached to the kit (Chyman Chemical Co., Inc.). Overall recovery of  $\text{TXB}_2$  in this extraction procedure was 90%. The  $\text{IC}_{50}$  values (concentration that produced 50% inhibition of  $\text{TXB}_2$  synthesis) for the compounds examined were determined from concentration-response curves.

In such compositions, one more of active compound(s) is or are admixed with at least one of inert aqueous diluent(s) (distilled water for injection, physiological salt solution etc.) or inert non-aqueous diluent(s) (propylene glycol, polyethylene glycol, olive oil, ethanol, POLYSOLBATE80 (registered trade mark) etc.).

Injections may comprise additional other than inert diluents: e.g. preserving agents, wetting agents, emulsifying agents, dispersing agents, stabilizing agent (lactose etc.), assisting agents such as assisting agents for dissolving (glutamic acid, aspartic acid etc.).

They may be sterilized for example, by filtration through a bacteria-retaining filter, by incorporation of sterilizing agents in the compositions or by irradiation. Other compositions for parenteral administration include liquids for external use, and endermic liniments (ointment etc.), suppositories and pessaries which comprise one or more of the active compound(s) and may be prepared by known methods.

wherein  $CyB^2$  is as defined in claim 1 for  $CyB$ , provided that  $CyB^2$  bonds to  $Z^1$  through a nitrogen atom in the  $CyB^2$  ring, and the other symbols are as defined in claim 1, to give a compound of the formula (IB):

wherein  $R^{41}$ ,  $Z$  and  $CyB^2$  are as defined above and the other symbols are as defined in claim 1; or  
 (c) reacting a compound of the formula:

wherein  $R^{41}$  and  $CyB^2$  are as defined above and the other symbols are as defined in claim 1 with a compound of the formula:

wherein all the symbols are as defined in claim 1, to give a compound of the formula (IC):

wherein R<sup>41</sup> and CyB<sup>2</sup> are as defined above and the other symbols are as defined in claim 1; and optionally converting the compound of formula (I) thus obtained into another compound of formula (I).

- 5      9. A pharmaceutical composition for the treatment of mammals, including humans, comprising as active ingredient, an effective amount of a compound of the formula (I), a pharmaceutically acceptable salt thereof or a hydrate thereof in association with a pharmaceutically acceptable carrier or coating.
- 10      10. A compound of the formula (I) as defined in claim 1, a pharmaceutically acceptable salt thereof or a hydrate thereof, for use as a medicament in the treatment of mammals.
